`/day6-triggers-soql/`

1. What is SOQL?

SOQL stands for Salesforce Object Query Language. It is used to retrieve data from Salesforce objects. It works similar to SQL, but it is designed specifically for Salesforce databases. For example, it can be used to get names, emails, or other record details from objects like Contact or Account.

2. What is an Apex Trigger?

An Apex Trigger is a code that runs automatically when a change happens in Salesforce records. It can execute when records are created, updated, deleted, or restored. Triggers are used to automate tasks and apply business logic in Salesforce.

3. Difference

Flow vs Trigger

Flow and Trigger are both used for automation in Salesforce, but they work differently. Flow is a no-code tool that uses a drag-and-drop interface, so it is easy for admins to create automation without writing code. Trigger, on the other hand, requires Apex coding and is used for complex business logic and advanced automation tasks.

Before Trigger vs After Trigger

A Before Trigger runs before a record is saved in Salesforce. It is mainly used to validate data or update field values before storing the record in the database. An After Trigger runs after the record is saved. It is used when actions need the record ID or when updating related records after saving.

4. Your Trigger Use Cases

Triggers can be used in many real-life situations. For example, they can automatically assign a default status when a record is created, send an email notification when an opportunity is closed, prevent deletion of important records, update related records automatically, and validate data before saving it.

5. Query Examples

Some common query examples are retrieving all customer names, finding contacts that have email addresses, showing all open opportunities, getting accounts created in the current month, and finding employees from a specific department.

6. Reflection

Enterprise systems react automatically to data changes because it helps organizations save time and reduce manual work. Automation improves accuracy, increases speed, and makes business processes more efficient.
