

1. Modules completed

- Salesforce Values: Quick Look
- Trailhead Playground Management
- Salesforce Developer: Quick Look
- Salesforce CRM
- Agentforce 360 Platform Basics
- Agentforce 360 Platform Development Basics
- Agentforce 360 Platform Events Basics
- Formulas and Validations
- Data Modeling
- Flow Builder Basics
- Apex & .NET Basics
- Data and Actions in Flows
- Apex Basics & Database
- Database & .NET Basics
- Search Solution Basics
- Apex Triggers
- Apex Testing

2. One learning from each module

- **Salesforce Values:** Success is based on trust, helping customers, and being fair to everyone.
- **Trailhead Playground:** A safe "sandbox" where you can practice without breaking a real business account.
- **Salesforce Developer:** You build tools using easy "point-and-click" settings first, then use code if needed.
- **Salesforce CRM:** A system that keeps all customer info in one place so every team sees the same data.
- **Platform Basics:** A foundation that lets you build custom apps that don't break during system updates.
- **Platform Development:** Use official Salesforce tools to build, test, and manage your custom apps.
- **Platform Events:** A way for Salesforce to instantly "talk" to other outside apps when something happens.
- **Formulas and Validations:** Rules that stop users from entering wrong or incomplete information.
- **Data Modeling:** Using "objects" (like digital spreadsheets) to organize and link different types of info.
- **Flow Builder:** A tool to create automatic steps (like sending an email) by drawing a visual map.
- **Data in Flows:** Allows your automated maps to find, create, or change specific records in the database.

- **Apex & .NET Basics:** Apex is the Salesforce coding language; it's very similar to C# or Java.
- **Apex Basics & Database:** Use a language called SOQL to find data and DML to save or delete it.
- **Database & .NET Basics:** Salesforce has "speed limits" (Governor Limits) to make sure one person's code doesn't slow down the whole system.
- **Search Solution:** Use SOSL to search for a word across many different areas at once.
- **Apex Triggers:** Code that runs automatically whenever a record is created, changed, or deleted.
- **Apex Testing:** You must prove your code works by writing "practice tests" before the system lets you use it.

3. One doubt/question simple english

If you need to make something happen automatically when a record is saved, how do you decide whether to use a "Flow" or an "Apex Trigger"?

4. Screenshot of Trailhead progress

The screenshot shows a Salesforce Trailhead profile for a user named Murari Naidu. The profile is displayed on a web browser with the URL `salesforce.com/trailblazer/profile`. The user's name is Murari Naidu, and they are a Student at Vishnu institute of technology in Andhra Pradesh, India. The profile includes a bio section with a link to add a short bio and a link to the user's Trailhead profile. The Trailhead section shows the user's progress: 21 Badges, 17,600 Points, and 4 Trails. The user is currently an ADVENTURER. The profile also includes sections for Certifications, Superbadges, and Agentblazer Status. The Certifications section shows the user's active certifications and a link to review or update their privacy settings. The Superbadges section shows the user's progress towards earning a Superbadge. The Agentblazer Status section shows the user's progress towards earning their first Agentblazer Status. The right sidebar shows the user's Trailhead progress, including a link to go to Trailhead, and a section for Questions & Answers with 0 Answers, 0 Accepted Answers, and 0 Questions.
