

- **System Overview:**

Explain that you built a system to help a college manage their students, teachers, classes, and departments in one place.

- **CRM Concepts:**

List the four main parts of your project: Student, Faculty, Course, and Department.

- **Data Model:**

Describe how you set up your database, including the objects, how they connect (relationships), and the specific information (fields) you track for each.

- **Validation Rules:**

Explain the rules you added to keep data clean, such as making sure a student provides an email or that a class doesn't go over its seat limit.

- **Flows:**

Describe the automated tasks you set up, like sending an automatic email when a student registers or warning a teacher about low student attendance.

- **Apex Logic:**

Explain the custom code you wrote for complex tasks, such as checking if a student is eligible for a class or handling large groups of data at once.

- **UI Screens:**

Show your user-friendly screens, including the Student Dashboard, Faculty Dashboard, and the Registration screen.

- **Complete Data Flow:**

Explain the journey of information in your system, for example, what happens step-by-step when a student signs up for a class.

- **Reflection:**

Write a short note about what you learned while building this project and how you solved any problems you ran into.
